A: In your code, even after copying the csv file to data/vega and running it on vega-lite server it still works. I can only suggest that you may want to consider to using 'curl' command to download the file from the URL address you have provided. Applications of the binary-selective stripping voltammetric technique to the determination of triazine herbicides in water samples. The electrochemical behavior of five triazine herbicides (imidazolinones, chlorotriazines, acetyl-triazines and pyrimidinyl thiophosphates) in aqueous media was studied using the binary-selective stripping voltammetric technique. The selectivity was achieved by addition of tetraoctylammonium (TOA) and hexyltrimethyl-ammonium (HTMA) cations to the supporting electrolyte. The optimum conditions for the stripping procedure were determined and the effects of the experimental variables (pH, concentration and nature of the organic modifier) were investigated. The presence of competing anions in the sample did not modify significantly the voltammetric behaviour of the herbicides studied. Thus, all the studied triazine herbicides can be determined in the presence of fluoride, chloride, nitrate and sulphate anions. The proposed method was successfully applied to the determination of five different triazine herbicides in several water samples, being the maximum concentration level reached by atrazine and metribuzin the regulated by the World Health Organization. Rhodium(III) complexes of hydroxamate-based aminotriazolopyridinone heterocycles: structure, selective inhibition of trypsin and leukocyte elastase. A new series of heterocyclic compounds derived from 2-amino-1,4-benzothiazol-3(2H)-one 1-oxide (HBT), the aminotriazolopyridinone heterocycle, have been prepared and structurally characterized by X-ray diffraction. The most interesting compounds are the rhodium(III) complexes [Rh(HBT)(2)(L)](2+), in which L = tert-butyl diethylphosphinate (L(2)), hexyl pentylphosphinate (L(2)), hexyl pentylphosphinate (L(2)), hexyl pentylphosphinate (L(2)), hexy
